NAME

xzmore, lzmore – view xz or lzma compressed (text) files

SYNOPSIS

xzmore [*file*...]
lzmore [*file*...]

DESCRIPTION

xzmore displays text from compressed files to a terminal using **more**(1). Files supported by **xz**(1) are decompressed; other files are assumed to be in uncompressed form already. If no *files* are given, **xzmore** reads from standard input. See the **more**(1) manual for the keyboard commands.

Note that scrolling backwards might not be possible depending on the implementation of **more**(1). This is because **xzmore** uses a pipe to pass the decompressed data to **more**(1). **xzless**(1) uses **less**(1) which provides more advanced features.

The command **lzmore** is provided for backward compatibility with LZMA Utils.

ENVIRONMENT

PAGER

If **PAGER** is set, its value is used as the pager instead of **more**(1).
